Cloud transformation strategy with QOS Consulting

For many companies, the cloud represents productivity, cost control, and risk management. Thanks to cloud innovations, IT infrastructure and business applications that once required equipment can now be accessed online through subscription-based services.

Cloud computing opens the door to new business possibilities, but it must be done right. Fast connections, near-flawless reliability, and security are prerequisites for a successful move to the cloud.

In fact, every business must ask, "Is the cloud right for our business?" For those companies that want to focus more on their core business practices than on building and maintaining IT infrastructure, the cloud has proved to be a valuable option. And yet, some enterprises place a high value on personal control on routine IT functions, or have legal or contractual obligations to do so, and are better served by staying with a traditional on-premises or private cloud solution. We understand and can help inform your decisions.

When it comes to cloud, we talk to business leaders every day who want assurances that their data will be secure, and the architecture is both flexible and can scale for growth. Leaders who need to understand how to integrate the cloud-based solutions with their other business systems. And that's what we're here for.

Call on QOS Consulting to guide your business through its exploration of cloud solutions and transition, whether going all in on the cloud or complementing your existing infrastructure through a hybrid deployment. QOS Consulting is a leading IT solutions provider focused on the provisioning of enterprise-grade cloud. Our expert team understands.

Why Use QOS

- Quickly and easily migrate systems to the cloud
- Leverage the skills and experience of dedicated migration specialists
- Experience little or no downtime during migration
- Remain in control of the cutover
- Shorten your time to implementation

Our cloud experts will help you develop a road map focused on addressing your security, productivity and performance needs, downtime exposure and manageability. Our cloud readiness assessment capabilities lay the foundation for a successful cloud strategy and migration and includes application and server dependency mapping, migration consulting and planning, migration execution, testing and validation, deployment and support.
